GLOBETREK · INTERNAL DEAL REVIEW

Deal Strategy and Commercial Proposal Package

Win the $480M travel OTA against Adyen in 87 days.

Prepared by Charles Barbier, as Elena Martins, Senior Account Executive · For the VP of Sales

A textbook fit, with an organizational risk we can manage

3 PSPs, 14 countries, hard-coded routing, no failover, cross-border acquiring in 6 of 8 corridors. What could make us lose is a skeptical CFO and a CTO with no capacity, both addressed in the first three weeks.

Why it fits

- 37% of TPV in Latin America, our strongest region, with Chile, Peru and Argentina still cross-border
- Travel references: Avianca, Viva Aerobus, PeruRail
- About $0.6M ARR in year 1, growing with a +50% TPV plan
- A compelling event: Stripe auto-renews on January 15

VERDICT

GO Full resources for 3 weeks.

Checkpoint at week 3: Dmitri's data, a meeting with Claudia, a signed pilot. If one is missing, we stop the full push and pursue a smaller LatAm-only deal.

Risks by type

COMPETITIVE

Adyen discounts hard for a logo before the Series C. Stripe's 3-year offer is the no-project option. Thin case studies in Europe and SEA (55% of TPV).

TECHNICAL

Local acquiring may need local entities (Brazil, Argentina, Saudi Arabia). CTO mid-migration. Stored cards locked in Stripe's vault.

FINANCIAL

MDR savings depend on acquirer pricing. OTA delivery risk means acquirers may ask for rolling reserves. Our year-2 ARR depends on their Series C.

ORGANIZATIONAL

Skeptical economic buyer. Dmitri's data is confidential from the board. Growth and CTO want opposite timelines.

What we don't know yet, and who tells us

Stripe notice period: real deadline may be December	CFO · wk 1
Decline codes by region, soft vs hard, 3DS drop-off	Dmitri · wk 1
How approval is measured: per attempt or per order	Dmitri · wk 1
Card mix: international, commercial, Amex	Dmitri · wk 2
Legal entities by country, merchant-of-record model	Finance · wk 2
Chargeback and fraud rates by region	Dmitri · wk 2
Reserves imposed by acquirers today	Treasury · wk 2
TPV split inside PayU and 2C2P	Dmitri · wk 1
Why Pix and OXXO feel missing when PayU offers them	Isabela · wk 2
Adyen's actual offer, Stripe's counter-offer	Dmitri · after Tue
Backend team size and Q1 capacity	Marco · wk 1

What each of the four needs, and how we engage them

Champion: Dmitri, who owns the data. Blocker: Marco, who can stop the deal without a number. Decision-maker: Claudia.

CFO · DECIDES

Claudia Méndez

BIGGEST GOAL

Processing cost at 2.1% or lower before the Series C

OUR VALUE

All-in 2.0%, payback month 5, one invoice and one dashboard, bargaining power over every PSP

OBJECTION, PRE-EMPTED

"Another vendor." No funds held, portable tokens, change-of-control clause, 90-day exit tied to pilot KPIs

HOW

Week 2 meeting with our exec sponsor, one-page ROI sent before, CFO reference call

HEAD OF PAYMENTS · CHAMPION

Dmitri Volkov

BIGGEST GOAL

Approval at 82%+: he sees $14-19M of bookings lost a year

OUR VALUE

Multi-acquirer routing, A/B splits, failover, soft-decline retries, new markets in 2-4 weeks

OBJECTION, PRE-EMPTED

"Unproven in Europe." A 20% A/B test in Spain and Germany against Stripe, success criteria written by him

HOW

Week 1 working session and data request, travel reference call, business case he presents himself

CTO · BLOCKER

Marco Stellini

BIGGEST GOAL

No engineering disruption during the microservices migration

OUR VALUE

One API, pilot built by our engineers, mobile SDKs for the Q1 app, firefighting from 20% to 5%

OBJECTION, PRE-EMPTED

"Single point of failure." 99.9% SLA, DR plan, his Stripe code kept as an emergency bypass

HOW

Week 1 technical deep dive with our SE and an integration engineer, sandbox on day 1

VP GROWTH · INFLUENCER

Isabela Rocha

BIGGEST GOAL

Fewer abandoned checkouts: 68% of carts today

OUR VALUE

More approved payments, lighter 3DS, local methods where missing, saved cards across providers

OBJECTION, PRE-EMPTED

"Show me 2-3 points." Conversion math on her funnel and an A/B test she designs

HOW

Week 2 checkout demo and joint test plan, live before the holidays

Neutralizing the blocker: four moves on Marco from week 1. If he still says no, Dmitri and Claudia make it a business decision on the pilot data.

1 · TAKE THE WORK OFF HIS TEAM

Yuno engineers build the pilot in our sandbox. His team reviews and deploys: 2 engineers, part time, about 10 weeks.

2 · LEAVE HIM IN CONTROL

He owns the architecture decision. His current Stripe code stays as the emergency bypass.

3 · TIE IT TO HIS NUMBER

Payment firefighting from 20% to 5% of backend time, measured together at month 6.

4 · SHOW YUNO LOWERS HIS LOAD

The 4 Q1 markets cost 4-6 weeks each without Yuno, configuration with it.

Five contradictions in the dossier, and our call on each

1 · CFO VS HEAD OF PAYMENTS

Cost or approval rate first?

OUR CALL

Cost with Claudia, approval rate to beat Adyen.

WHY

Claudia decides, and our net savings ($2.6M) are larger than the recovered margin ($1.6M). Adyen also cuts cost; only routing across acquirers lifts approval. Today's real cost of payments: 2.56% in fees plus about 0.4% of TPV in lost margin.

2 · CTO VS HEAD OF PAYMENTS

No disruption, yet 4 new markets in Q1

OUR CALL

The new markets are our argument for Marco.

WHY

Without Yuno, each market costs 4-6 weeks of development per provider, during his migration. With Yuno, it's configuration. Sequence: pilot built by our engineers, Colombia first, Indonesia and Thailand after his migration.

3 · THE 84-86% BENCHMARK

Validate it or push back?

OUR CALL

Push back gently and commit by region.

WHY

OTA traffic has high tickets, international and commercial cards, and bookings made far ahead. We commit to 76.9% in year 1 and 80%+ in year 2; the benchmark itself averages 81% on their mix.

4 · STABILITY VS A YOUNGER VENDOR

Yuno is younger than Stripe and Adyen

OUR CALL

Answer it in the contract.

WHY

The risk is where money and data sit. Yuno holds no funds, GlobeTrek keeps its acquirer contracts, tokens are portable, and a change-of-control clause covers an acquisition. Series B of $45M; clients include Arcos Dorados, Rappi and Avianca.

5 · VP GROWTH VS CTO

60 days or 6 months?

OUR CALL

Both are right, for different scopes.

WHY

The pilot (Chile/Peru plus 20% of Spain and Germany) is live in about 7 weeks, in time for holiday experiments. The full migration takes 5-6 months, at Marco's pace.

WHO WE WORK FIRST

Why Marco is the blocker, not Claudia

Claudia is skeptical, but she decides on numbers, and ours answer her target. Marco can stop the deal without a number: no engineering time, no pilot, no proof before January 15.

Where the savings and the approval gains come from

CORRIDOR	TODAY	DESIGN WITH YUNO	PROVIDER TRADEOFFS
Europe	Stripe, US cross-border	Local EEA acquirer on IC++, Stripe kept for failover, UK acquired separately (UK-EEA interchange 1.15-1.5% since Brexit). Co-badged French cards routed on Cartes Bancaires. SCA: TRA exemption through the acquirer with the lowest fraud rate; corporate exemption for business travellers' cards	Adyen: strong approval data, wants volume and a full migration. Checkout.com: flexible on IC++, strong in travel and the Gulf. Worldpay: long travel history, heavier onboarding. Two of them compete on markup
Brazil	PayU, local	Second local acquirer, Pix after a card decline, installments (parcelado) priced per acquirer	Cielo: widest issuer reach. Rede (Itaú): strong on Itaú cards. Stone: lower pricing, modern APIs. Local acquiring needs a CNPJ, otherwise dLocal or EBANX
Mexico	PayU, local	Second acquirer (BBVA, Banorte or Santander) through Prosa, meses sin intereses for a $340 ticket, OXXO kept	OXXO vouchers expire in 1-3 days: align the booking hold with the voucher window
Argentina	PayU, cross-border	Payway (Prisma) or Fiserv with a local entity, otherwise dLocal or EBANX. Cuotas	FX controls make USD settlement the main constraint
Chile, Peru	Stripe, cross-border, cards only	Transbank or Getnet in Chile, Niubiz or Izipay in Peru. Webpay, Khipu, Yape, PagoEfectivo	Transbank has the reach; Getnet is easier to integrate and negotiate
SG, MY, PH	2C2P, local except PH	2C2P kept with a second route; local acquirer plus GCash and Maya in the Philippines. Ready for Indonesia (QRIS, GoPay, OVO) and Thailand (PromptPay)	2C2P is strong where it acquires locally; Xendit or Midtrans in Indonesia
UAE, Saudi Arabia	Stripe, cross-border, cards only	Checkout.com, Network International or Amazon Payment Services; mada for Saudi debit, Apple Pay, Tabby or Tamara for high tickets	Saudi acquiring may need a local entity: checked in week 2

All corridors: network tokens and Account Updater (not counted in the base case). Retries only on soft declines and within scheme rules: Visa caps reattempts at 15 in 30 days, Mastercard's Merchant Advice Codes forbid retrying some declines. As an OTA (MCC 4722), GlobeTrek sells now and delivers later, so acquirers may ask for rolling reserves: negotiated together with the MDR.

From 2.56% to 1.90% before our fee, through local acquiring on IC++

Yuno doesn't set the MDR: GlobeTrek signs IC++ contracts with local acquirers we connect, and routing sends each transaction to the cheapest route likely to approve it. Every target sits at or below the low end of the dossier's own benchmark (local acquiring cuts cost by 30-60%).

CORRIDOR	TPV	MDR TODAY	TARGET	SAVINGS	HOW
Europe (ES, FR, DE, UK)	$195M	2.70%	1.70%	$1.95M	Local EEA acquirer on IC++ instead of US cross-border (consumer interchange capped at 0.2-0.3%), Stripe kept as failover, Cartes Bancaires routing, UK acquired separately
Mexico, Brazil, Argentina	$130M	2.30%	1.95%	$0.46M	Second local acquirer (Cielo, Rede, Stone or Getnet in Brazil; BBVA or Banorte in Mexico), Pix after card declines, Argentina local or local-like (dLocal, EBANX)
Chile, Peru	$48M	2.70%	2.00%	$0.34M	Local acquiring: Transbank or Getnet in Chile, Niubiz or Izipay in Peru
Singapore, Malaysia, Philippines	$72M	2.50%	2.20%	$0.22M	2C2P kept in SG/MY with a second route, local acquirer plus GCash and Maya in the Philippines
UAE, Saudi Arabia	$35M	2.70%	2.10%	$0.21M	Local acquiring (Checkout.com, Network International), mada for Saudi debit, Apple Pay
Total	**$480M**	**2.56%**	**1.90%**	**$3.17M**	**$12.30M today → $9.13M. Minus the Yuno fee ($0.59M): net $2.58M, all-in about 2.0%**

Conservative case (Europe at 1.90%, other corridors +0.1 point): $2.50M gross. New acquirers may ask an OTA for rolling reserves: negotiated together with the MDR in every contract. The European card-mix assumption is on page 8.

+4 points of approval, $13M of bookings recovered, $1.56M of gross profit

Method: attempted volume = approved TPV ÷ approval rate; extra approved volume = attempted × points gained; only 50% counted as truly incremental, since some customers already retry with another card. Our $13M sits below Dmitri's own $14–19M estimate.

REGION	APPROVAL TODAY	BENCHMARK	YEAR-1 TARGET	GAP CLOSED	ATTEMPTED	INCREMENTAL TPV	WHY THIS UPLIFT
Europe	76%	84–86%	80%	50%	$256.6M	$5.13M	Local acquiring, SCA exemptions (TRA, corporate cards), network tokens
Mexico	68%	79–82%	71%	27%	$73.5M	$1.10M	Already local: second acquirer, soft-decline retries
Brazil	71%	81–84%	74%	30%	$77.5M	$1.16M	Already local: second acquirer, Pix after a card decline
Argentina	64%	72–76%	69%	63%	$39.1M	$0.98M	Cross-border to local or local-like
Chile, Peru	69%	78–81%	75%	67%	$69.6M	$2.09M	Cross-border Stripe to local acquiring
Singapore, Malaysia	78%	83–86%	80%	40%	$66.7M	$0.67M	Already local: failover, second route
Philippines	72%	80–83%	77%	63%	$27.8M	$0.69M	Cross-border to local acquiring
UAE, Saudi Arabia	74%	82–85%	79%	63%	$47.3M	$1.18M	Local acquiring, mada
Total	**72.9%**		**76.9%**		**$658M**	**$13.0M**	**× (14% take rate − 2.0% processing) = $1.56M a year**

We push back on the 84–86% benchmark: OTA traffic carries high tickets, international and commercial cards. We commit by region: 76.9% in year 1, 80%+ in year 2. The benchmark itself averages 81% on their mix. MX, BR and SG/MY splits are assumptions. Conservative (half the points): $0.78M. Upside (100% incremental): $3.12M.

The assumptions behind the numbers, with their sources

At or below the dossier's benchmarks wherever it gives one. Marked (A) where it gives none, with an owner to confirm it in week 1–2.

Assumption register

ASSUMPTION	VALUE	SOURCE OR REASONING
European blended MDR	1.70%	(A) Card mix: 50% EEA consumer at ~0.65% all-in (interchange capped at 0.2–0.3%), 25% commercial ~2.3%, 15% non-EEA ~2.4%, 10% Amex ~2.8% = 1.55%, rounded up
MDR cut, cross-border corridors	22–37%	Dossier: local acquiring cuts cost by 30–60%. We sit at or below the low end
Approval uplift	+2 to +6 pts	Dossier: local acquiring lifts approval by 8–15%. Our +4–6 pts on cross-border corridors = 5–9% relative; +2–3 pts where already local
Recovered volume truly incremental	50%	(A) Some declined customers already retry with another card. The pilot's control group measures it
Margin on recovered bookings	12%	Dossier take rate 14%, minus 2.0% processing cost
TPV split inside PayU and 2C2P	MX 50, BR 55, AR 25; SG/MY 52, PH 20 ($M)	(A) Not in the dossier. Dmitri confirms in week 1
Ramp	18% → 100%	Pilot corridors in months 3–4, 50% in month 5, 75% in month 6, full from month 7

Operational savings

ITEM	HOURS/YR	$/YR
Engineering firefighting, 20% → 5% of backend time ((A) 15 engineers, $110K loaded)	3,800	$250K
Finance reconciliation, 3 dashboards → 1 ((A) 1 of 1.5 FTE)	1,700	$70K
Support, 4.2 days → under 1 day per failed payment ((A) 30% of 2 FTE)	1,000	$30K
Market launches: 4 markets × 5 weeks → 1 week of configuration	640	in eng.
Total	**7,100**	**$350K**

Implementation cost ($X) and timeline (Y)

2 engineers × 10 weeks ($45K) + product, QA, finance and legal ($40K) + parallel running and acquirer onboarding ($30K) + 50% contingency = **$170K**, up to $250K. Y = 2 months to the pilot, 6 months to full migration. Break-even in month 5.

SENSITIVITY

Incrementality 30–70%: ±$0.62M. European MDR ±0.2 pt: ±$0.39M. Approval ±1 pt: ±$0.39M. All at their worst at once: still above $2.5M a year.

12 bps on approved transactions only. Paid back in month 5.

GlobeTrek pays nothing on declines. The case stays above $2.5M a year even with every assumption at its worst value.

Total annual value

	CONS.	BASE	UPSIDE
Net processing savings	$1.91M	$2.58M	$3.00M
Recovered gross profit	$0.78M	$1.56M	$3.12M
Operational savings	$0.20M	$0.35M	$0.50M
Total	**$2.89M**	**$4.49M**	**$6.62M**

Operations: about 7,100 hours a year (engineering firefighting from 20% to 5%, reconciliation, support, market launches). New markets in 2–4 weeks instead of 2–3 months. Detail on page 8.

Pricing

- **12 bps on approved TPV**, no fee on declines, no setup or gateway fee: $0.59M in year 1, $0.86M at $720M
- All-in about 2.0%: under the CFO's 2.1% target, with a margin for uncertainty
- Hybrid by design: bps plus a $35K monthly minimum from month 4. Tiers: 10 bps above $600M, 9 bps above $900M. A flat SaaS fee was rejected: easy for Adyen to undercut, and it doesn't grow with their TPV
- 2-year term, 90-day exit if pilot KPIs are missed. Price guarantee: 9 bps if all-in cost stays above 2.1% for reasons on our side
- vs Adyen at 2.2–2.4%: $0.9–1.8M a year cheaper. vs Stripe's 2.5% for 3 years: $2.3M cheaper, no lock-in

Cumulative value, net of $170K implementation

Base case. Pilot at 18% of TPV in months 3–4, 50% in month 5, 75% in month 6, 100% from month 7. Year-1 net value $2.7M (16x the implementation cost); $1.6M conservative (6x).

elena.martins@y.uno

Each answer admits what is true and ends with a test they control

Claudia Méndez, CFO

"I've read that orchestration platforms add another layer of vendor dependency. If Yuno goes down, all our payments fail. With our current multi-provider setup, at least we have redundancy. Why is your model less risky?"

You're right that Yuno is one more vendor, and it's the right question before a Series C. Today each country is hard-coded to one provider, so you have three single points of failure: if Stripe goes down, Europe, Chile, Peru and the Gulf stop. With Yuno, if an acquirer fails, the transaction moves to another one automatically. On our own risk: we never hold your money, the funds settle directly from your acquirers to your accounts, and you keep your contracts with every PSP. Your card tokens can be exported, so you're never locked in. We'll put a 99.9% uptime SLA with service credits in the contract, and your current Stripe integration stays in place as an emergency bypass that your team controls. Arcos Dorados runs McDonald's payments in 21 countries through us on the same principle. Finally, the contract has an exit at 90 days if the pilot doesn't hit the targets we agree in writing, and you only pay us on approved transactions.

Dmitri Volkov, Head of Payments

"Your case studies are mostly Latin America: Brazil, Mexico, Colombia. We do $195M in Europe and $72M in Southeast Asia. How do I know you can deliver 82%+ approval rates in Germany, Singapore, and UAE? Stripe and Adyen have way more data and scale in those markets."

You're right that most of our published cases are in Latin America, and I won't pretend otherwise. Our best-known numbers, like inDrive at about 90% approval, come from there. In Germany, Singapore or the UAE, approval depends mostly on the acquirer: whether it's local, and how it handles 3DS2 and exemptions. Stripe and Adyen have deep data on their own network. We route across several networks, Adyen included if it performs best in a corridor, and retry soft declines on a second route. You saw that logic at Booking. So let's test it on your $195M in Europe: 20% of your Spain and Germany traffic through a local EEA acquirer via Yuno, 80% on Stripe as the control, and you write the success criteria. If we don't move approval by 3 points in four weeks, you'll know before January 15. Singapore and the UAE follow with the same test. On 82%: I'd rather commit to 80% in Europe in year one and beat it than promise 82% everywhere.

Marco and Isabela: engineering effort and conversion

Marco Stellini, CTO

"We're mid-migration to microservices and launching a new mobile app in Q1. My team is at capacity. I can't dedicate 2 engineers for 6 months to rip out our payment stack and integrate Yuno. This is bad timing."

I understand, and I wouldn't ask for six months. You integrate one API once, and the 4-6 weeks you spend today per provider per market go away, including for the four markets Dmitri wants in Q1. For the pilot, our integration engineers do the heavy work in our sandbox, and your team reviews and deploys it. The realistic ask is two engineers, part time, for about ten weeks. Since you're moving to microservices anyway, payments can become one clean service calling one API, with webhooks for every status. For the new app, our mobile SDKs give you one integration that covers every provider. Your current Stripe code stays as the emergency bypass, under your control. You'll get the API docs, the SLA and the disaster recovery plan before our technical session, so you can judge them before committing anything. And we'll measure the result on your number: payment firefighting from 20% of backend time down to 5%.

Isabela Rocha, VP of Growth

"I care about conversion, not backend infrastructure. Our current checkout flow already supports cards and a few local methods. How does Yuno improve my conversion rate by more than 2-3 points? That's the threshold where I'd care."

Fair threshold. Today about 27 of every 100 payment attempts fail. Our base case recovers 4 of them, 6 in Chile and Peru. With 68% of carts abandoned, roughly 44 of every 100 carts reach the payment step, so approvals alone add about 1.8 points of overall conversion. Two more levers take you past your bar. The first is 3DS: Stripe's flow is where customers drop today, and a clunky 3DS step can add 10-30% abandonment. Exemptions and frictionless flows remove that step for most European cards. The second is the methods your customers don't have yet: cards only in Chile and Peru, no mada in Saudi Arabia, no GCash in the Philippines, no Bizum in Spain. Saved cards also work across all providers, so repeat customers, a third of your base, pay in one click. We can measure it with an A/B test in Chile and Peru, live in about 45 days, before the holidays, with your metrics.

87 days to January 15: pilot data in the CFO's hands first

If nothing happens, Stripe renews for a year at a higher price. If Stripe's notice period is 30-60 days, the real deadline is earlier: we check it in week 1.

WHEN	MILESTONE	OWNER
Week 1	Before Adyen's Tuesday pitch: data request and Stripe notice period with Dmitri, vendor-criteria list. Technical deep dive with Marco's team. CEO intro email to Claudia.	AE, SE
Week 2	Model v2 on real data. Exec sponsor dinner with Claudia. Test design with Isabela.	AE, exec sponsor
Week 3	Pilot agreement signed: Chile/Peru + 20% of Spain and Germany. Acquirer onboarding and Stripe card export started. Checkpoint (see decision).	AE, partnerships
Weeks 4-7	Pilot built mostly by Yuno engineers, live around week 7, before the holiday freeze.	SE, integration
Weeks 5-6	Pricing proposal and contract redlines, in parallel with the build.	AE, legal, deal desk
Weeks 9-10	Pilot readout against a same-days control group. Dmitri presents the business case to Claudia.	Dmitri, AE
Week 11	Contract signed. Stripe kept as one lane on a short renewal with no commitment, or notice given by corridor.	CFO, AE, legal
Week 12 · day 87	January 15 passes without a 3-year Stripe lock-in. Q1 rollout plan, Colombia first.	CSM, SE

Resources I need from Yuno

- **Solutions Engineer** who has led 3+ travel or airline implementations (Avianca, Viva Aerobus) and can go deep with Marco's team on APIs, webhooks and failover. 40% of their time for 10 weeks
- **Two integration engineers**, weeks 3-7, to build the pilot for GlobeTrek's team
- **Acquiring partnerships**: local acquirers in the EEA, Chile, Peru, the Philippines and Saudi Arabia; entity requirements; reserve terms
- **Exec sponsors**: our CEO for Claudia (he met their CMO), our GM EMEA for Dmitri
- **Customer Success Manager** named from the pilot
- **References**: a travel client's head of payments for Dmitri, a CFO for Claudia
- **Legal**: SLA with credits, 90-day exit, change of control, token portability, DPA
- **Pricing approval**: floor at 9 bps, implementation fee waived, pilot credits

What could go wrong, and how we de-risk it

RISK	MITIGATION
Stripe's notice period ends before pilot data	Checked in week 1. If needed, Claudia takes a short Stripe renewal with no commitment in week 3, instead of the 3-year deal
Marco's team has no time for the technical evaluation	Yuno integration engineers build the pilot for them. If it still stalls, Dmitri and Claudia make it a business decision
No local entities, so less local acquiring than modelled	Local-like providers (dLocal, EBANX) in Latin America. Re-run the model in week 2 and tell Claudia the corrected numbers ourselves
Acquirers ask an OTA for rolling reserves	Negotiated with the MDR, chargeback history as evidence, volume moved in steps
Stored cards locked in Stripe's vault	Stripe exports card data to a PCI-compliant vault on request. Request it in week 3 so returning customers keep their saved cards
Pilot shows less than +3 points in Europe	Criteria agreed upfront. Latin America and cost savings still carry the case. Narrow the scope to what the data supports
Holiday traffic distorts the pilot results	A control group on Stripe over the same days, so seasonality hits both sides equally
Holiday freeze on deployments	Go-live planned for week 7. Freeze dates confirmed with Marco in week 1
Adyen offers Claudia a below-cost deal	Compare all-in cost including approval. Offer Adyen as a lane behind Yuno
Dmitri's confidential data reaches the board through us	Nothing goes to Claudia without his agreement. He presents the numbers

How we beat Adyen, and our call

Our wedge is speed, backed by price and approval

- **Faster:** our pilot is live with real data in about 7 weeks. Adyen needs 3-6 months to go live, after January 15. Claudia decides on our results, against their promises
- **Cheaper:** all-in about 2.0% against Adyen's 2.2-2.4%, or $0.9-1.8M a year
- **Better approval:** about +4 points from routing across several acquirers, with failover and retries on a second route, which one PSP alone doesn't offer
- **Change the question:** from "which PSP" to "never depend on one PSP". Adyen can be a lane behind Yuno
- **Shape the criteria before Tuesday:** Dmitri brings our questions into Adyen's pitch: failover, local acquiring in Chile, Peru and Saudi Arabia, go-live time, token portability
- **Flank:** win Marco (3-6 months of integration during his migration) and Isabela (nothing live before the holidays). Claudia then hears "Yuno first" from her CTO and her growth lead
- **We don't delay their evaluation:** it would cost us Dmitri's trust and Claudia's respect
- **Attention:** a top account for us, with a named SE, CSM and our CEO; a mid-size one in Adyen's enterprise queue

DECISION

GO

Full-court press, not a polite pass

The pain is measured ($14-19M of lost bookings, 2.56% against a 2.1% target), the deadline is real, the deal is about $0.6M ARR in year 1 and grows with their TPV, and our edge is where Adyen and Stripe are weakest.

Why not pass: Adyen would take a 14-country OTA in our strongest region, and the cost of trying is capped at three weeks.

Checkpoint at week 3: Dmitri's data, a meeting with Claudia, a signed pilot. If one is missing, we stop the full push and pursue a smaller LatAm-only deal.
